

PERPETUAL INVENTORY EXCELLENCE

Foundation for Depot Performance

AI GENERATED

THE PRINCIPLE

Inaccuracy in your stock file is the root cause of poor replenishment, lost sales and availability failures. Whether you need comprehensive wall-to-wall counts or targeted audits of specific ranges, our team establishes whether your DC stock levels are accurate. We provide the operational foundation for reliable depot performance by confirming that your digital stock file reflects physical reality.

We work at the speed of your DC. Our perpetual inventory services fit your operational schedule and give you the oversight you need to prevent ghost stock – items that appear on your system but do not exist in the pick slot. A clean stock file allows your WMS and replenishment systems to function as designed.

Our approach rests on evidence. We count and we investigate the discrepancies we find, so you can see where and why stock integrity is drifting. That restores confidence in your systems and lets your planners work from accurate data rather than manual adjustments or safety stock buffers.

THE PROVISION

An accurate stock file is the heartbeat of a successful distribution centre. RAS Supply Chain Integrity PI counts provide the verification necessary to maintain flow and eliminate systemic errors. Our data proves that **1 in 53 instances** results in overpayment by the retailer for goods not received but invoiced.

- **Flexible Scope:** Tailored PI counts ranging from specific high-value categories to comprehensive wall-to-wall audits.
- **Operational Health:** Proactively identifies and corrects stock file inaccuracies to prevent replenishment failures.
- **Data Integrity:** Aligns system records with physical reality, providing the clean data needed for effective WMS operations.
- **Root-Cause Investigation:** Goes beyond simple counting to identify why errors occur.
- **Optimised Performance:** Supports efficient replenishment and pick operations by ensuring that WMS targets accurately match inventory availability, both at pick slot and high-level.

KEY BENEFITS

- **Availability Boost:** Ensures replenishment is based on actual, not theoretical, stock.
- **Ghost-Stock Elimination:** Prevents systemic over-ordering or missing stock events.
- **Replenishment Accuracy:** Maximises the efficiency of WMS and forecasting algorithms.
- **System Trust:** Empowers operational teams to trust their data.

**“A stock file is only as good as the last physical audit.
If you aren’t validating, your system is just guessing.”**
